The problem

- Determining the reference of NPs helps to generate correct articles and Noun's number when translating from Japanese to English

Example

私はりんごが好きです。

- I like apple.
- I like apples.
- I like the apple.
- I like the apples
- ...

The problem

- Determining the reference of NPs helps to generate correct articles and Noun's number when translating from Japanese to English

Example

私はりんごが好きです。

- I like apple.
- I like apples.
- I like the apple.
- I like the apples
- ...

What is NP?

NP = Noun Phrase

- Noun is the main element.
 - Articles
 - Number (Singular/Plural)

What is NP reference?

Definition

To understand the way a noun is being used within a sentence.

The authors consider 3 types of reference:

- Referential
- Generic
- Ascriptive

Referential NPs

- Refers to some entity in the discourse world.
- Introduce a potential identity.
- Can be pronominalized.
- Can be modified by all determiners.
- Can be plural or singular.

Example

私はマンモスを探している。 I'm looking for a mammoth

Default interpretation for all NPs.

Referential NPs

- Refers to some entity in the discourse world.
- Introduce a potential identity.
- Can be pronominalized.
- Can be modified by all determiners.
- Can be plural or singular.

Example

私はマンモスを探している。 I'm looking for a mammoth

Default interpretation for all NPs.

Referential NPs

- Refers to some entity in the discourse world.
- Introduce a potential identity.
- Can be pronominalized.
- Can be modified by all determiners.
- Can be plural or singular.

Example

私はマンモスを探している。 I'm looking for a mammoth

Default interpretation for all NPs.

Generic NPs

- Refers to **kinds**, not single members.
- Can't be modified by all determiners.
- Grammatical number is fixed.
- Take 3 forms in English:
 - Indefinite singular “*a*”
 - Definite singular “*the*”
 - Bare plural and generic ϕ

Example

- A mammoth** is a mammal.
- The mammoth** is a mammal.
- Mammoths** are mammals.
- Furniture** is expensive.

Generic NPs

- Refers to **kinds**, not single members.
- Can't be modified by all determiners.
- Grammatical number is fixed.
- Take 3 forms in English:
 - Indefinite singular “*a*”
 - Definite singular “*the*”
 - Bare plural and generic ϕ

Example

- A mammoth** is a mammal.
- The mammoth** is a mammal.
- Mammoths** are mammals.
- Furniture** is expensive.

Ascriptive NPs

- Ascribe an attribute to another NP.
- Complement of a *copular* verb.
- Agree with their target in number.

Example

- A computer is **a tool**.
- Computers are **tools**.
- The students are **a mob**

Ascriptive NPs

Not all complements of copular verbs are ascriptive:

- Predicational

Example

私の指導者はいいい人です。

- Specificational

Example

私の指導者はX さんです。
X さんは私の指導者です。

Why is referentiality necessary?

Memory

昔々、あるところに
、おじいさんとおば
あさんがいた。おじ
いさんは芝刈りに
、おばあさんは洗
濯に行った。

When a noun first appears, there's nothing in the memory.

Why is referentiality necessary?

Memory

おじいさん ←
おばあさん ←

昔々、あるところに
 、おじいさんとおば
 あさんがいた。おじ
 いさんは芝刈りに
 、おばあさんは洗
 濯に行った。

The noun is added and **indefinite article** is used.

Why is referentiality necessary?

Memory

おじいさん
おばあさん

昔々、あるところに
、おじいさんとおば
あさんがいた。おじ
いさんは芝刈りに
、おばあさんは洗
濯に行った。

The second time a noun appears, it will be already in memory, thus, **definite article** is used.

1. Nouns that appeared before.

Using the rule applied in the previous slide:

Example

像は哺乳類であり、マンモスも哺乳類である。

Elephants are mammals and mammoths are also the
mammals

1. Nouns that appeared before.

Using the rule applied in the previous slide:

Example

像は哺乳類であり、マンモスも哺乳類である。

Elephants are mammals and mammoths are also **the**
mammals

2. Concordance in number

Example

有名なシャーロックホームズ探偵の物語は大抵ロンドン地域を背景にしたものです。

The tales of famous detective Sherlock Holmes normally have the London area as a background

2. Concordance in number

Example

有名なシャーロックホームズ探偵の物語は大抵ロンドン地域を背景にしたものです。

The tales of famous detective Sherlock Holmes normally have the London area as a background

3. Determining the correct number

Example

この日は社員は来ません。

Employees do not come on this day

3. Determining the correct number

Example

この日は社員は来ません。

Employees do not come on this day

Definition

Search for patterns within a sentence to determine:

- Structure
- Type

Example

If the subject is marked by one of the focus markers は or も, and the verb is past tense, then the sentence has a specificational reading.

子供はボールで遊んだ

Search for patterns...

Definition

Search for patterns within a sentence to determine:

- Structure
- Type

Example

If the subject is marked by one of the focus markers は or も, and the verb is past tense, then the sentence has a specificational reading.

子供はボールで遊んだ

Specificational

Creation

Rules are created to be applied to the original text **in the transfer phase**.

3 levels of rules:

- 1 Clause Level
- 2 Case-element Level
- 3 Modification of and within the NP

All proper nouns and pronouns are assigned the value **referential**

Creation

Rules are created to be applied to the original text **in the transfer phase**.

3 levels of rules:

- 1 Clause Level
- 2 Case-element Level
- 3 Modification of and within the NP

All proper nouns and pronouns are assigned the value **referential**

Example

— The subject of a **specificational** sentence is referential (and definite).

問題は困難であった。 **The problem** was difficult.

— The complement of the copula in a **predicational** sentence is ascriptive.

マンモスは動物である。 Mammoths are **animals**.

— The complement of として is ascriptive:

それをマンモスとして扱って。 Treat it as **a mammoth**.

— Locative NPs are **referential**.

空港に行った。 I went to **the airport**.

— An NP whose head is modified by a relative clause is **referential**.

店で買ったプレゼント。 **The gift** I bought at the store.

...

Outline

- 1 Introduction

Countability of Nouns

Based on countability, nouns are divided in:

- Fully countable: **knife**
- Both countable
 - Strongly countable: **cake**
 - Weakly countable: **beer**
- Uncountable: **furniture**
- Pluralia tantum: **scissors**

Generic NPs

GT	FC	BC	U	PT
a	a mammoth	a cake	*a furniture	*a scissors
the	the mammoth	#the cake	#the furniture	#the scissors
ϕ	mammoths	cake/cakes	furniture	scissors

GT: **Generic Type**

FC: **Fully Countable**

BC: **Both Countable**

U: **Uncountable**

PT: **Pluralia Tantum**

- # = Cannot have *generic* reference.
- * = Ungrammatical

Referential NPs

Special rules are used to determine Referential NPs:

Example

— Determine according to verb:

話題が**つ**きた。 I ran out of **topics**.

— Determine according to adjunct:

全国の**学**校。 **Schools** all over the country.

— Specific function words that mark plurality:

達 = plural and countable

Trigger Nouns

Definition

Nouns that have been manually identified and marked in the lexicon

- Basically refers to NPs that in English use a possessive pronoun but in Japanese is often omitted.

Example

財布を落した。 I lost **my wallet**

Trigger Nouns

Definition

Nouns that have been manually identified and marked in the lexicon

- Basically refers to NPs that in English use a possessive pronoun but in Japanese is often omitted.

Example

財布を落した。 I lost **my wallet**

Selecting determiners for referential NPs

Example

— place nouns heading locative NPs are **definite**

空港に行った。 I went to **the airport**

— NPs whose head is modified by a relative clause is **definite**

昨日来た男。 **the man** who came yesterday

— An NP whose head is modified by one of certain modifiers is **indefinite**

ある男。 **a certain man**

Ascriptive NPs

As heuristic, all ascriptive NPs are **indefinite** = articles will be generated in the same way as for indefinite referential NPs:

- Countable singular NPs will take the **indefinite article**.
- Countable plural and uncountable NPs will take ϕ .

Example

- 癌は**病気**だ。 Cancer is **a sickness**.
- 子供は**天使**だ。 The children are **angels**.

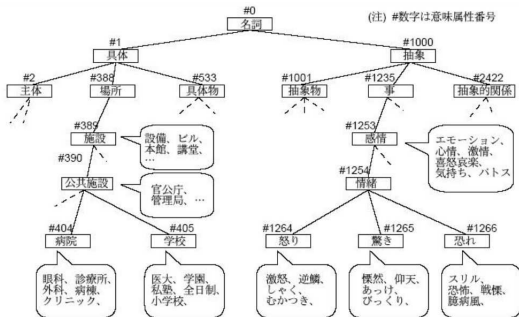

Outline

- 1 Introduction
 - Understanding the problem
 - NP reference
 - Referentiality in Natural Language Processing
- 2 Determination of Reference
 - Rules
- 3 Application to Translation
- 4 Evaluation
 - ALT-J/E
 - Result
 - Discussion

Description

All the process described has been implemented in ALT-J/E Machine Translation System.

- Developed by NTT Labs between 1982 and 1986
- Very robust
- Uses a 2,715 semantic hierarchy for common nouns

Procedure

- The algorithm was evaluated on a collection of newspaper articles from the Nikkei-Sangyo newspaper by an English native speaker not connected with the development of the algorithm.
- The results were compared against an old version of ALT-J/E.

Algorithm	NPs(717)	Sentences(102)
New	85%	36%
Old	65%	5%

Evaluation values

Each NP was given one of the following values:

best: The most appropriate article and number.

analysis: Problem with the parse.

NP structure: Problem with NP structure or choice of translation.

dictionary: Problem with the dictionary.

article: Inappropriate article

number: Inappropriate number.

possesive: Inappropriate use of possessive determiner.

countability: problem with countability.

reference: problem with reference property.

- For a sentence to be judged as **correct** all the NPs must be correct.

Correct example

Example

会員は 37,000 円、非会員は 47,000 円の参加費が必要。

- New:** **Members** need 37,000 yen as the registration fee and **non-members** need 47,000 yen.
- Old:** **A member** needs 37,000 yen as the registration fee and **a non-member** needs 47,000 yen.

Errors

Problem	Frequency
Analysis	7%
Dictionary	7%
NP structure	18%
Reference	13%
Number	25%
Articles	26%
Possessive	5%

Unrecognized example

Example

NTTは新会社 NTT テレコムエンジニアリング東京を8日付で設立する。

- NTT will establish **a new company**. NTT Telecom Engineering Tokyo, on the 8th.

Example

新会社の資本金は800万円。

- The capital of **a/the new company** is 8 million yen.

Summary

- **Referentiality** is an important concept necessary in order to get high-quality translations.
- Some **rules** used to determine NP referentiality in Japanese-English Machine Translation were presented.
- Although the method has been proven to be efficient, several problems remain to be explored.
